

**Fantasy meets technology.**

In 1938, Disney purchased eight oscillators from HP founders Bill Hewlett and Dave Packard for use in the sound design of *Fantasia*. Since this collaboration, Disney has relied on HP technology for projects ranging from feature film development to a wireless translation device for hearing-impaired and non-English-speaking park guests.

**A new challenge arises.**

Walt Disney Imagineers came up with a unique concept: an attraction that allowed visitors to experience the thrill of space flight. They had a dream of combining the technology of an aerospace training simulator with classic Disney storytelling to create an experience that accurately replicated the thrill of traveling through space.

**The collaboration takes off.**

As the computing power behind NASA's Mission Control, HP was the perfect technology provider for *Mission: SPACE*. HP engineers and Walt Disney Imagineers relied on HP IT architecture, workstations and servers in creating the most technologically advanced attraction in Disney's history.

**Mission: SUCCESSFUL**

Now open at *Epcot*® at *Walt Disney World*® Resort, *Mission: SPACE* is perhaps the most thrilling attraction ever created. Even real astronauts who've experienced it are impressed by its accuracy. It's definitive proof that when creativity meets technology, truly everything is possible.
