

US Postal Service + hp

The amazing journey

The US Postal Service® is one of the great marvels of modern industry. Placed into operation more than 225 years ago, today the US Postal Service operates on a massive scale, responsible for the timely delivery of 650 million letters and packages each day.

HP delivers.

With the help of HP technology and services, the US Postal Service is able to stay remarkably connected, a critical component of performing the colossal task of delivering more than 200 billion pieces of mail each year.

Postal technology

HP is involved at every level of the US Postal Service. HP AlphaServers play a part in scanning, processing and distributing each piece of mail. 160,000 HP desktops and laptops provide the hardware. And Web tools developed by HP help customers track packages, obtain shopping rates, pay bills and order stamps online all at one place: USPS.com.

The mail never stops.

By definition, success for the US Postal Service is determined by how little most of us pay attention to our mail. If their customers don't give mail delivery a second thought, then the US Postal Service and HP have done their job.

US Postal Service, USPS and the white mail truck with a painted belt-line are registered trademarks of the United States Postal Service, used with permission.
